Fujikura PANDA fiber solutions

- Fujikura has been developing below new PANDA fibers for customer solutions.
 - For Blue LD, Blue LED products designers
SC48-P, SM63-P · UV/UV coating series
 - For RoHS Directive PANDA cord users
Lead-free, non-halogen PANDA cord series
 - For Laser diode or modulator for 10G telecom designers
UV coating series
 - For flame retardant users such as telephone office users
Flame-retardant series
 - <15mm winding diameter users
80 microns cladding diameter series
 - For lower temperature dependence users as coupler manufacturers
Low birefringence series

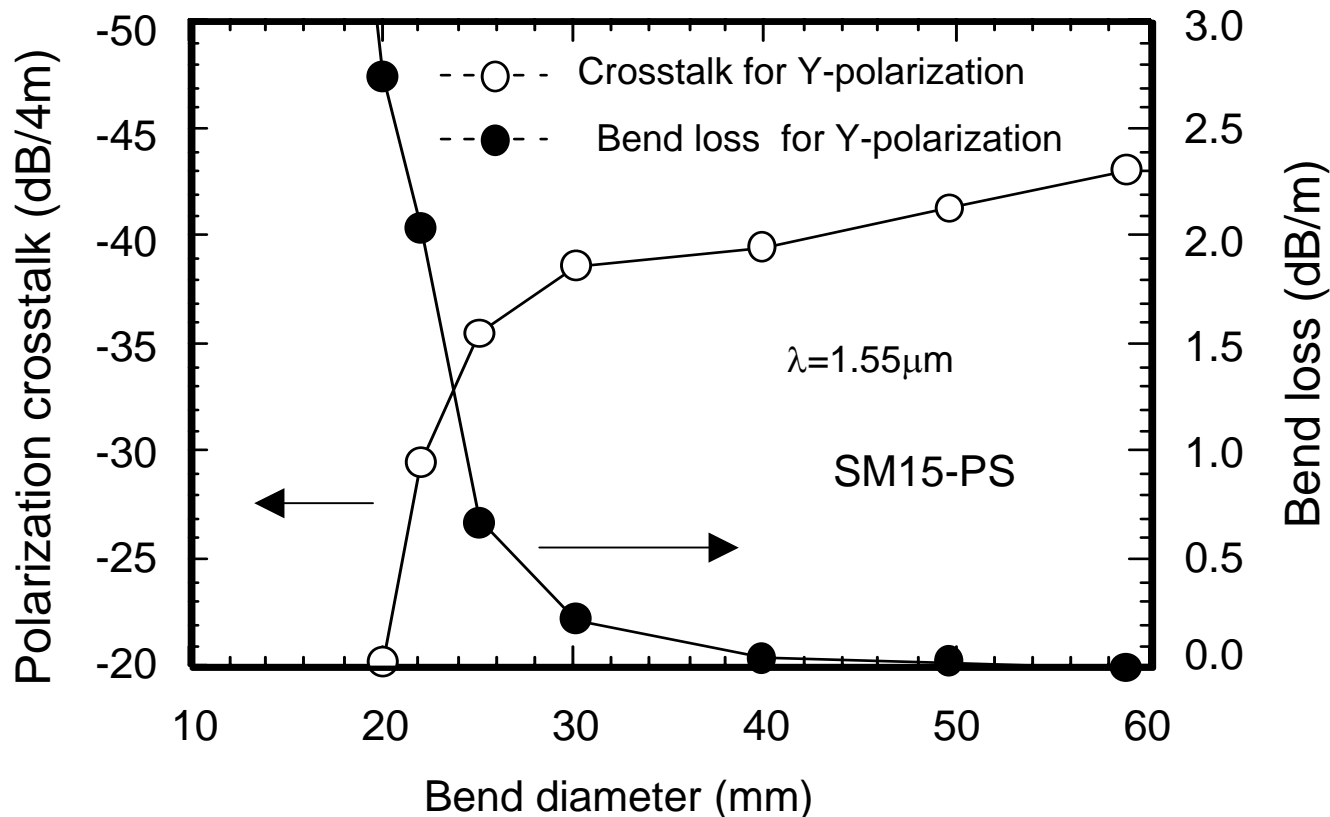

Fujikura is challenging for customer solutions to meet various needs.

Bend performance of 125 μm cladding PANDA

- No significant performance degradation in a bend diameter ≥ 40 mm of 2% proof test PANDA fibers.
- 1% proof should be bent $\geq D60\text{mm}$ due to life time.

Flame retardant PANDA fiber

- UL94-V-0 Polyester-elastomer Resin over coating
- UL1581-VW1 Flame retardant
- Alternative from Nylon coating fiber
- Wavelength:0.85,0.98,1.3,1.45,1.55 μ m, DSF

Features of RC-PANDA fibers 1

1. Higher birefringence for lateral pressure endurance

$$B = 4C \frac{f}{\pi \cdot E} \frac{1}{r}$$

C: Photo Elastic constant
E: Young's modulus

$$B = 2C(1 - \cos\theta \cdot \sin\theta) \frac{f}{\pi \cdot E} \frac{1}{r}$$

Re-design Stress applying parts

2. Attenuation and MFD non-circularity optimization

- B_2O_3 , OH absorption increase
- MFD non-circularity increase

To improve above, reduce slightly MFD diameter.

Features of RC-PANDA fibers 2

3. Smaller bending radius tolerance

$$B = \frac{1}{2} C \frac{r^2}{R^2}$$

- For good bending property,
Bending loss
Bending crosstalk
should be small both.

**Higher aperture design and
achieve good results**

4. Splice loss optimizing

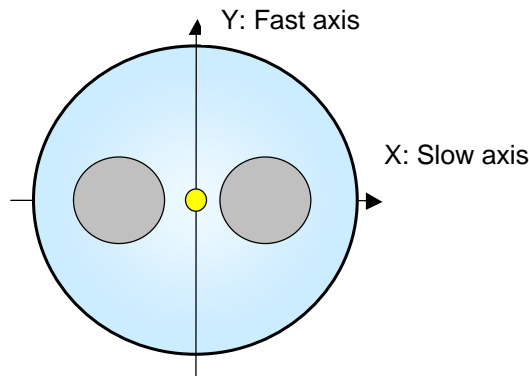

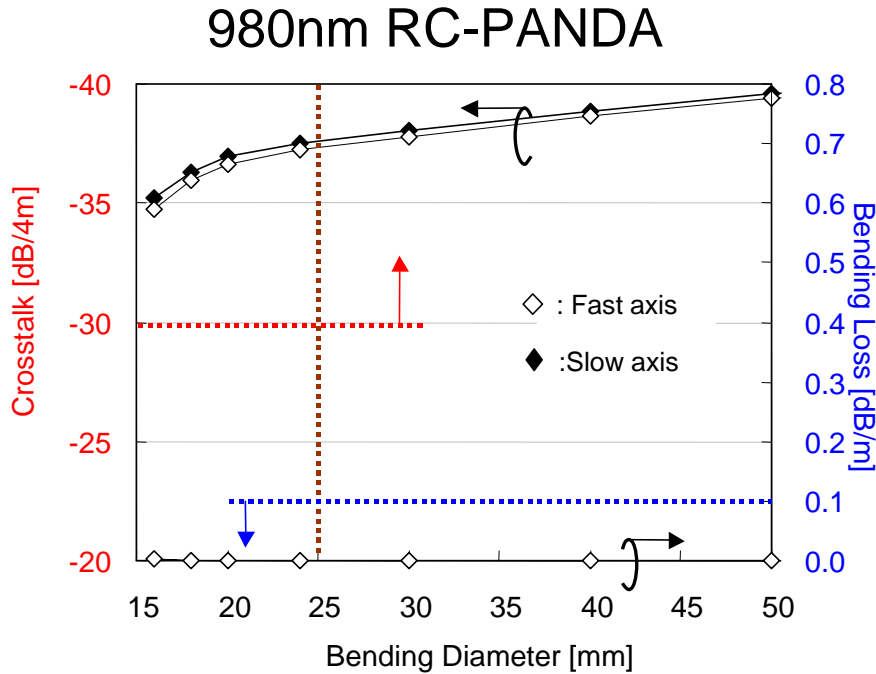

Telecom component
⇒ Need low splice loss with
different major fiber splices

Requirement:
Splice loss < 0.1dB

**MFD differences with other fibers
are designed within slight level**

PANDA fibers for sensors

- Stable sensing against external perturbations
- Connecting fiber to sensor light source
- Suitable for faraday effect sensing fibers
(UV/UV coating type of 0.63, 0.48 μm were started to release)
- Blue laser cutoff wavelength is also available

Typical wavelength characteristics of sensor 0.48,0.63 PANDA

Low birefringence PANDA fiber

- Optimized birefringence for polarization devices
 - Suitable for temperature sensitive polarization devices
 - SAPs (Stress applying parts) interval is widely located
 - Lower birefringence than standard PANDA
 - SAP thermal expansion coefficient is less effective that temperature dependence should be stable

Basics of Polarization maintaining fibers

Fiber Optics Network Products Engineering Department
Fujikura Ltd.

Polarization modes in ideal SM fiber

- A Single-mode(SM) fiber has two degenerated orthogonal polarization modes, which have the identical propagation constant: $n_x=n_y$, $b_x=b_y$
- Rotational asymmetries such as core ellipse or lateral stress induce birefringence and lift the degeneracy.

Polarization in ideal SM fiber

- An ideal SM fiber with perfect rotational symmetry can maintain any state of polarization.
- If any stress induces on the fiber or a fiber has a non circular core...

Stress-induced birefringence

- Rotationally asymmetrical stress changes refractive indices for two orthogonal polarization direction (birefringent axes): photo-elastic effect.
- As a result, the two orthogonal modes are separated: $n_x > n_y$, $\beta_x > \beta_y$: stress birefringence.

$$B = n_x - n_y = C(\sigma_x - \sigma_y)$$

•C:Photo Elastic constant

External stress due to bend or lateral pressure

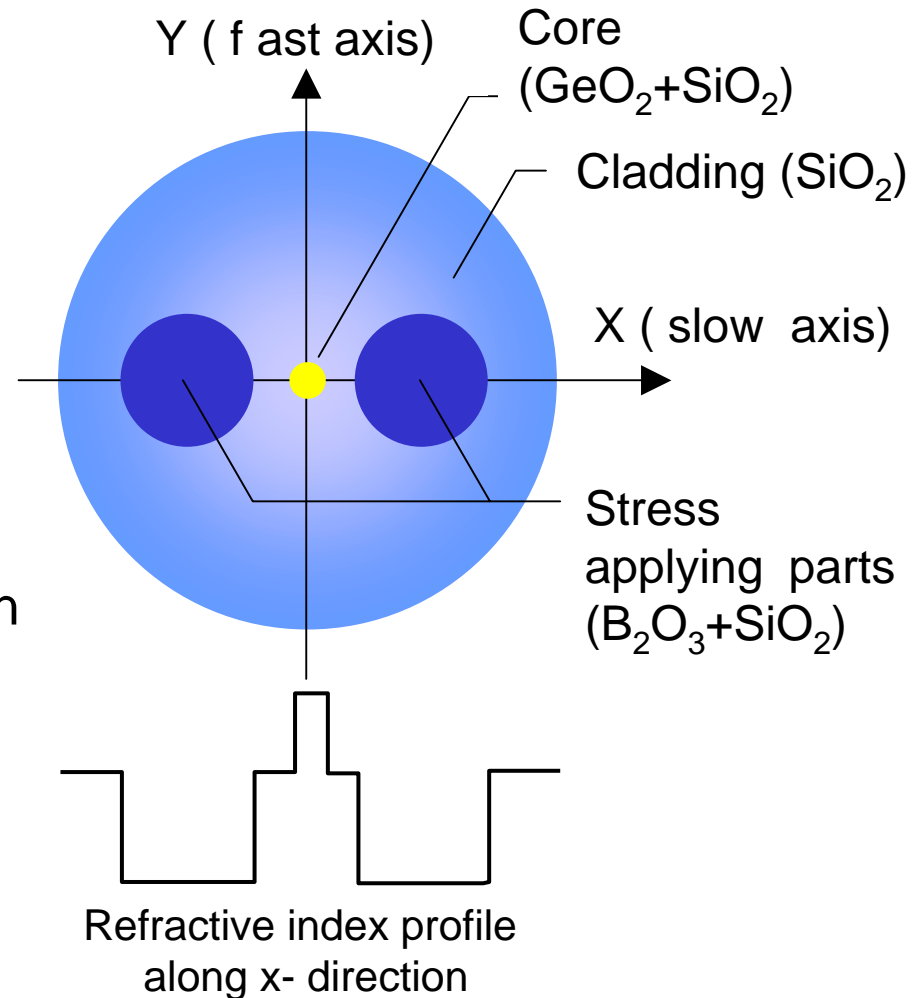

Polarization in actual SM fiber

- Stress-induced phase difference causes polarization change.
- State of polarization at output is not stable.

Structure of PANDA fiber

- Boron-doped SAP (Stress applying parts) have higher thermal coefficient of expansion than the cladding.
 - SAP: 3×10^{-6} / degree C
 - Cladding: 5×10^{-7} / degree C
- The SAP shrinks more than the cladding during cooling process of drawing.
- Tensile stress of SAP direction remains in the core induces large stress birefringence.

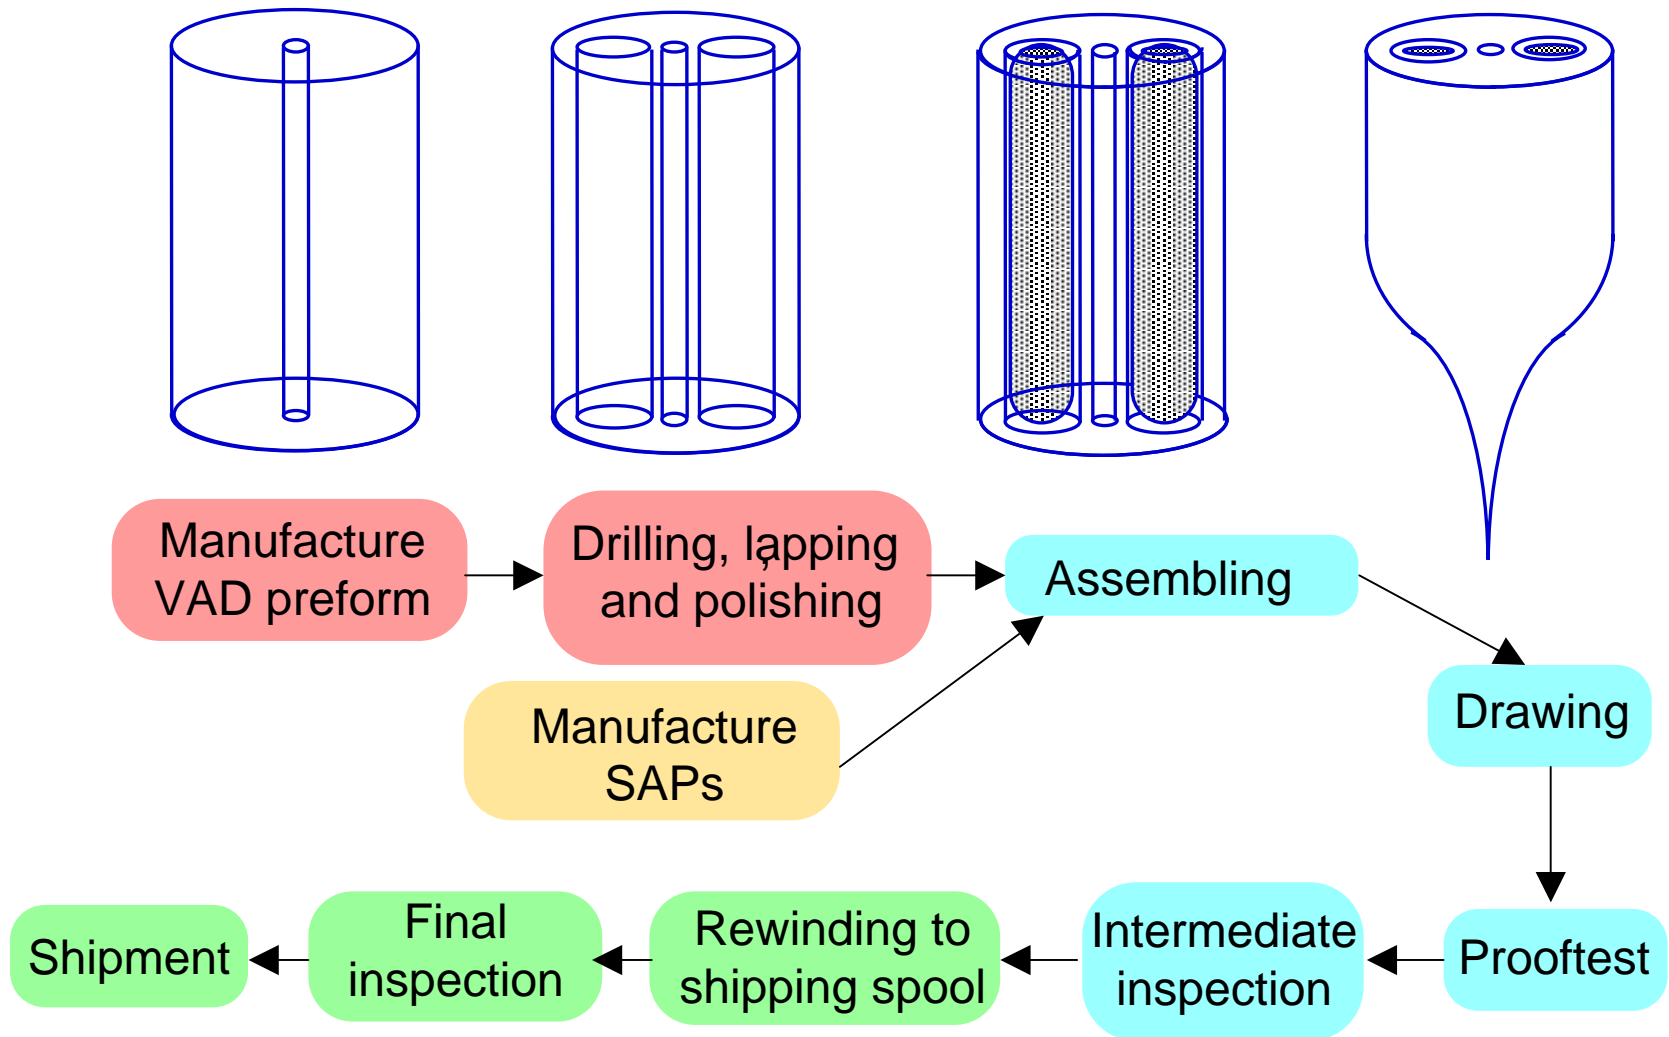

How to preserve polarization

- A fiber with high internal birefringence can maintain linear polarization against external perturbations since its birefringent axis rotation is small.

Beat length

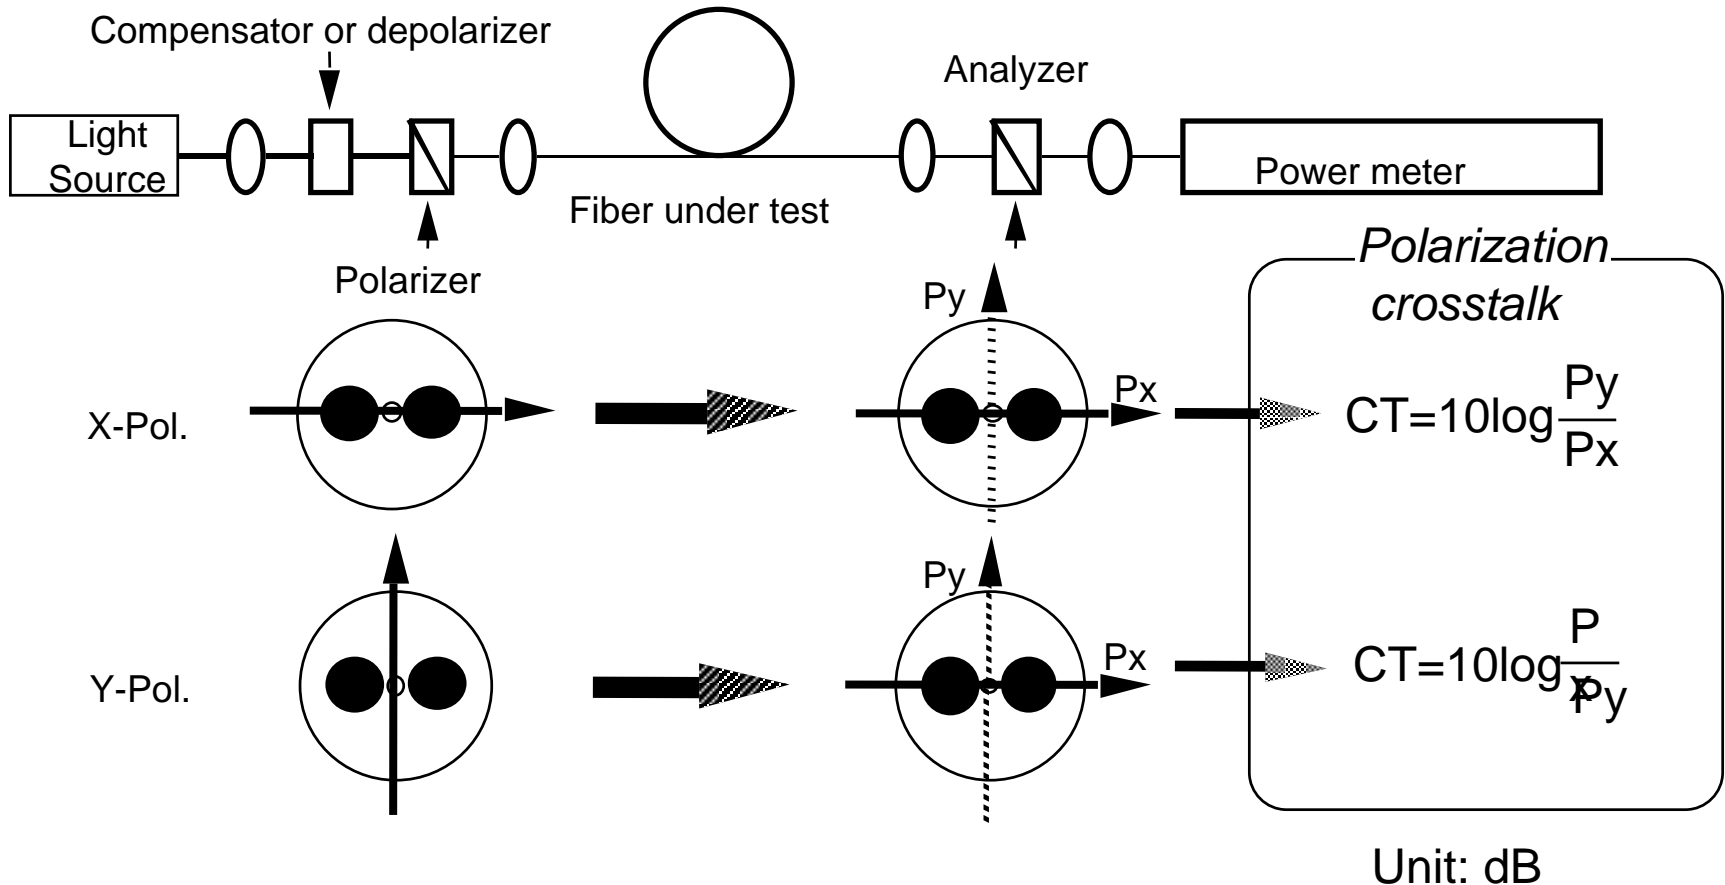

- Beat length L_b is one cycle of periodical polarization variation along a PM fiber.
- Related to modal birefringence as follows:

$$L_b = \frac{\lambda}{B}$$

Measurement of polarization crosstalk

Measure the extinction ratio of output light while input linear polarization is launched into input.

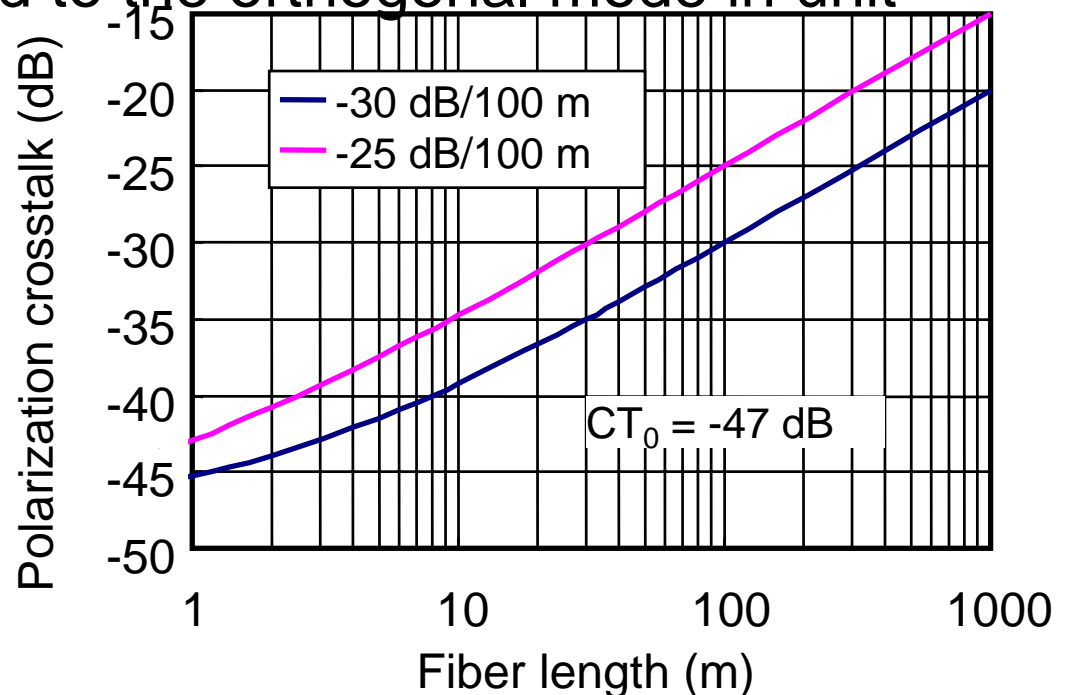

Power coupling coefficient

- Polarization crosstalk in linear expression is proportional to fiber length through random mode-coupling.
- Power coupling coefficient, h-parameter, is defined as a power coupled to the orthogonal mode in unit length.

$$h = \frac{\tan^{-1}(\eta)}{L} \approx \frac{\eta}{L}$$

$$\eta = \frac{P_y}{P_x} = 10^{CT/10}$$

L: Fiber Length

Summary of Fujikura PANDA fiber

- Low attenuation and low polarization crosstalk with superior designing and manufacturing.
- High dimensional symmetry and uniformity.
 - Suitable for splicing, connectorizing and optical devices.
- High reliability proofed in actual system and customer
- New series are released as ongoing developments
 - Lead-free, non-halogen PANDA cord series
 - Sensing
(SM48-P, SM63-P, RCHA85-P, HA13-P UV/UV series)
 - Flame retardant coating
 - 80 micron cladding
 - Low birefringence

Fujikura is challenging for customer solution together.
